

HW1

A.

Input layer = 120

2x Hidden layer = 256

Stored at 8-bits

120 → 256
256 → 256
256 → 10

Output layer = 10

Total parameters = 99338

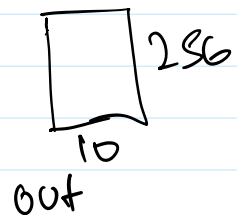

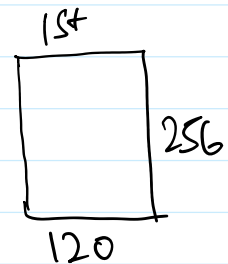

$$1^{\text{st}} \text{ layer} = 120 \cdot 256 = 30720$$

$$1^{\text{st}} \text{ hidden layer} = 256 \cdot 256 = 65,536$$

$$2^{\text{nd}} \text{ hidden layer} = 256 \cdot 10 = 2560$$

$$\text{Biases} = 256 + 256 + 10 = 522$$

$$= 99338$$

B.

Total MAC's would be : 1st layer + 1st hidden layer + 2nd hidden layer

$$= 30720 + 65536 + 2560$$

$$= \boxed{98816}$$

C. Temporary SRAM req :

$$\begin{aligned}\text{Input} &: 120 + 256 = 376 \\ \text{1st hidden} &: 256 + 256 = 512 \\ \text{2nd hidden} &: 256 + 10 = 266\end{aligned}$$

1st hidden layer has the largest amount of bytes so the temp SRAM req = 512

2

A. Input layer : 1280

2x Hidden layers : 512 stored at 32-bits

Output layer : 32

$$\text{1st layer} : 1280 \times 512 = 655360$$

$$\text{1st Hidden layer} : 512 \times 512 = 262144$$

$$\text{2nd Hidden layer} : 512 \times 32 = 16384$$

$$\text{Total param without Bias} = 655360 + 262144 + 16384 = 933888$$

$$\text{Bias} = 512 + 512 + 32 = 1056$$

$$\text{Total Parameters} = 933888 + 1056$$

$$= 934944$$

$$32 \text{ bit} = 4 \text{ bytes}$$

$$\text{Total Storage} = 934944 \cdot 4$$

$$= \boxed{3,739,776 \text{ bytes}}$$

B. Total param without bias = 933,888

80MHz computing 1 MAC every 4 cycles

$$\text{Time} = \frac{4}{80} \cdot 933888$$

$$= \frac{46,694.4}{1000} = \boxed{46.69 \text{ ms}}$$

C. Temp SRAM req:

$$\text{Input} : 1280 + 512 = 1792$$

$$\text{1st hidden layer} : 512 + 512 = 1024$$

$$\text{2nd hidden layer} : 512 + 32 = 544$$

Since the input layer is the largest,
at 4 bytes the temp SRAM storage = $1792 \cdot 4$
 $= \boxed{7168 \text{ bytes}}$
